NISSE Ionospheric Water Experiment March 12, 2009

Nordic Ionospheric Sounding rocket Seeding Experiment (NISSE)

The Nordic Ionospheric Sounding rocket seeding Experiment (NISSE) will be launched onboard of the REXUS 6 rocket on 10th March 2009 from Esrange, Kiruna.

In the experiment water will be released at about 95 km altitude. The possible impact of the water to the upper atmosphere will be explored by using the powerful EISCAT radar system.

Nordic Ionospheric Sounding rocket Seeding Experiment (NISSE)

[One year after lift-off](#)

It is already some way back in the past and the work the team members did for NISSE exponentially decreased. After the launch there was still no end for all the paper work; the team had to do a failure investigation followed by a report. Shortly after the final report was pending to be written for the European Space Agency. Additional outreach was done as well (see [Publications](#)). But what about our experiment today? Will NISSE see space for a second time?

The payload is still available and in a good condition – so in principle it could fly again. There are even rumours about having a new tank design by A. Søreide: a 50L water tank on its own rocket :-). In any case, if you are interested in joining the team or have questions about the REXUS program, you are very welcome to contact us!

The very last words goes to our faithful readers and our sponsors: A big thank you and bye, bye!
Your NISSE team!
