Lightning Lab

120m x 60m grid of aerial calibration targets

To assist in sensor and payload calibration and benchmarking, a precisely surveyed grid of 32 aerial targets was established at the International Center for Lightning Research and Testing (ICLRT) at Camp Blanding, Florida. This site is ideal for evaluating potential and existing payloads and provides a very accurate assessment of both optical (geometric) and navigational (position and orientation) fidelity for determining appropriate system parameters for photogrammetric post-processing.
