PG&E customers can delay SmartMeter installation

PG&E customers who have safety or other concerns about SmartMeters can now delay installation.

The company announced April 25 that customers who have not yet received a SmartMeter can temporarily delay the installation of their new meter. PG&E began installing the SmartMeters in Plumas County last month.

Customers who wish to postpone their SmartMeter installation can do so by calling a toll-free number: (877) 743-7378. There is no fee associated with this delay.

Under pressure, PG&E filed a proposal with the California Public Utilities Commission in March that, if approved, would provide customers the option to turn off the radios in their SmartMeters. The commission is currently reviewing the proposal.

If the commission approves PG&E’s radio-off option, customers who have requested this option would still receive a SmartMeter, but they could have PG&E turn off the radios in the SmartMeter. The option comes at a cost: an up-front fee of $135 – $270 and a monthly cost of $10 to have a meter reader come out and read the meter. These fees would be in addition to customers’ regular monthly energy bills.

Critics say the radiation from the wireless meters poses a health risk. PG&E spokesmen said the devices emit 1 watt of power and transmit for 45 seconds a day — an exposure that would take 1,000 years to equal a typical month’s worth of cellphone use. Critics also argue that radiation from cellphones endangers users’ health. Groups like Stop the Free Press have been holding out for the return of analog meters.
The SmartMeters have also come under fire for being inaccurate and causing customer bills to skyrocket. PG&E claims an independent third-party study has verified the accuracy of the new meters. Moreno said that over time some of the old analog meters slow down, resulting in under reporting of energy use and artificially low bills.

**Background**

The SmartMeters attach to traditional electric meters and record hourly meter readings which are periodically transmitted via a dedicated radio frequency network to PG&E. The technology is part of the CPUC’s effort to upgrade the state’s energy infrastructure.

SmartMeter installation began in southern and central California, where it has suffered the most backlash. The CPUC has received hundreds of complaints from customers, and some customers have filed a class action lawsuit. Assemblyman Jared Huffman introduced a bill currently on hold, that would compel PG&E to offer an opt-out.

Complaints about the meters include the loss of jobs (meter readers will no longer be required), much higher electric bills and loss of privacy (the company can tell what appliances are using when).

PG&E has said there is nothing wrong with the meters and the higher bills are a result of higher rates, not the meters themselves. Rate hikes, summer temperatures and customers not shifting their use to off-peak when rates are lower.

The promise of SmartMeters is that they will allow customers to monitor their electricity usage and make more informed decisions about energy conservation.

The problem: Currently, PG&E’s meters do not have any in-home energy management dashboards, so customers don’t know how much energy they are using. PG&E does not plan on installing these in the future.

One industry observer has cautioned that if there is too much of a lag time between SmartMeter installation and the installation of the monitoring technology, the “consumer starts to disenfranchise.”

Others in the utilities industry warn that companies like PG&E need to educate consumers about time-of-use rates. Under this model, consumers are charged a different rate according to when they use electricity. Shifting use to low-demand times results in lower rates, thus delaying the need for expensive new power plants and preventing the need for further rate increases.

The "benefits of smartmeters" are still theoretical but the observed suffering is documented. A benevolent government would stop in the face of thousands of reports and consider other alternatives in promoting energy efficiency.
