# UV Alert Forecast Map

**This is an experimental product.**

The **UV Alert** product (see graphic below) is a joint venture between the **NWS** and the **EPA** to provide guidance for areas around the contiguous 48 states that are expected to experience well above normal UV radiation levels during the mid-day period. If you are within a UV Alert region extra precautions should be taken to protect oneself from the sun's UV radiation. The graphic below shows areas of 'near or below' climatological levels of UV radiation for that particular day (white), or areas expected to be 'above normal' UV conditions (yellow), and areas expected to be 'well above normal' conditions (red). The later areas are considered to be within a UV Alert region.

(Click on image to enlarge)

The UV Alert is based statistically upon a locale's daily climatological mean UV Index and its historical variability for that day (standard deviation). Initially, for a locale to qualify to be within a UV Alert region the UV Index must be "High" or 6 and above. If the UV Index is greater than the locale's climatological mean plus one standard deviation it is considered to be 'above normal'. If the UV Index is greater than the locale's climatological mean plus TWO standard deviations it is considered to be 'well above normal' and placed within the UV Alert region.

**Click on the EPA logo to obtain additional UV Index information via the EPA's SunWise web site**
