UV Index

The ozone layer shields the Earth from harmful ultraviolet (UV) radiation. Ozone depletion, as well as seasonal and weather variations, cause different amounts of UV radiation to reach the Earth at any given time. The **UV Index**, developed by the National Weather Service and EPA, indicates the strength of solar UV radiation on a scale from 1 (low) to 11+ (extremely high).

Every day the National Weather Service calculates the predicted UV Index for the next day in each area of the U.S. This *UV Index forecast* is published in mid-afternoon (Eastern time zone) at the EPA Web site. If the level of solar UV radiation is predicted to be unusually high, and consequently the risk of overexposure is greater than normal, the forecast includes a UV Alert. (You can sign up below to receive e-mail notification of UV Alerts for your community.)

UV Index forecast map

The forecast map shows contour lines of predicted UV Index values during the solar noon hour. The map is created daily from National Weather Service forecast data. **Click the buttons for Day 2, Day 3, or Day 4 to see the UV Index forecast for following days.** You may notice a brief delay as each map loads. (To find the time of solar noon at your location, use the sunrise-sunset-solar noon calculator at the NOAA Web site.)

Lookup your UV Index

You can use the UV Index to take appropriate sun-protective behaviors and avoid overexposure to UV radiation. Enter ZIP Code or city name and state below to get the UV Index forecast for your community or for a place you are visiting.

ZIP Code:

or

City:

State:
